

## Data exploration

The following data looks specifically at Pennsylvania data

```
library(tidyverse)
library(cowplot)
library(reticulate)
library(lmtest)
library(forecast)
```

## Power plants

```
np = import("numpy")
dat = np$load("model_dev_data/phil.npz")
locs = as.data.frame(dat["locs"])
names(locs) = c("fid", "lon", "lat")
df = as.data.frame(t(dat["X"]))
names(df) = paste0("_", dat["locs"][,1])
df = df %>%
  add_column(ym = dat["ym"], .before=1) %>%
  pivot_longer(names_to="fid", values_to = "so2", cols = -ym) %>%
  mutate(date=lubridate::ymd(paste0(ym, "01")))

head(df)
```

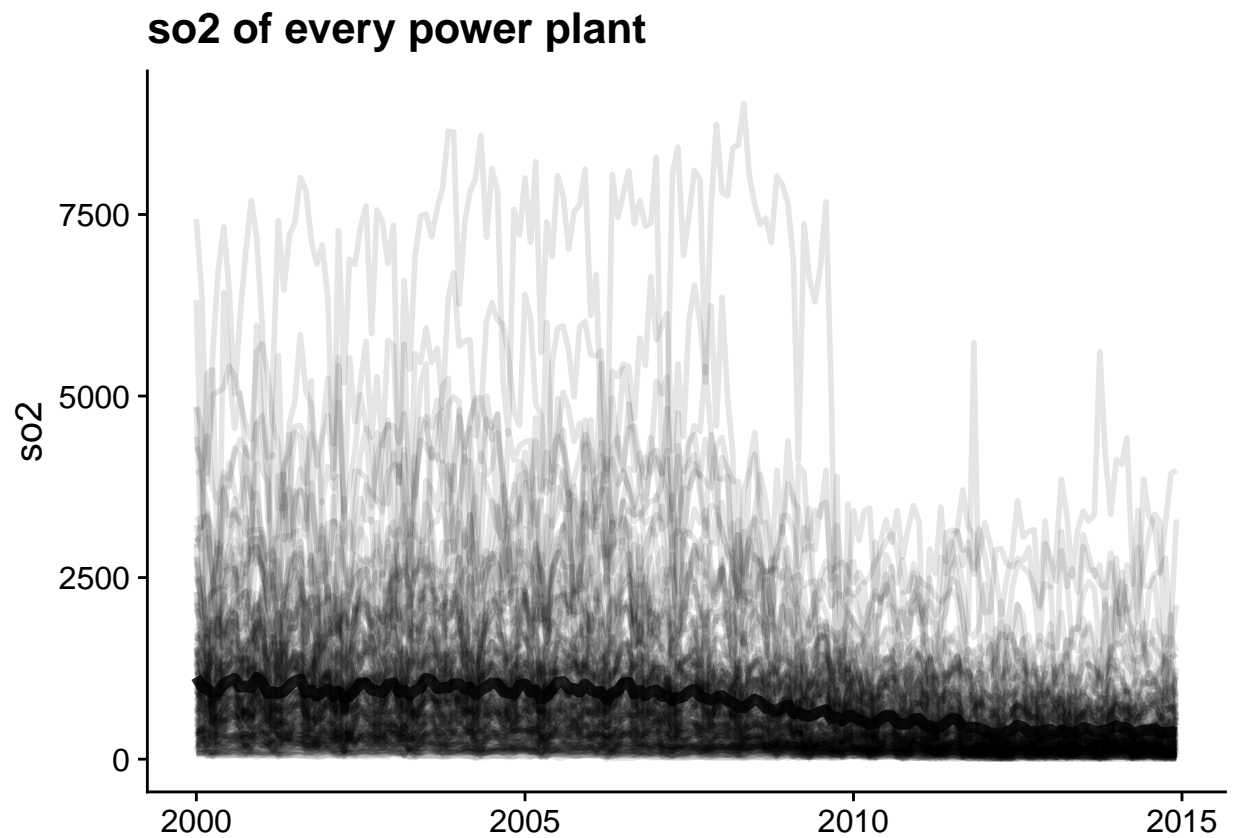

```

From the next plot it is evident that we need a transformation to make the behavior of the pollution more stable. We can perform a power transform to stabilize variance.

```

Let's look at different histograms for the one-day difference series.

```

Plotting auto-correlations and fitting auto-arimas

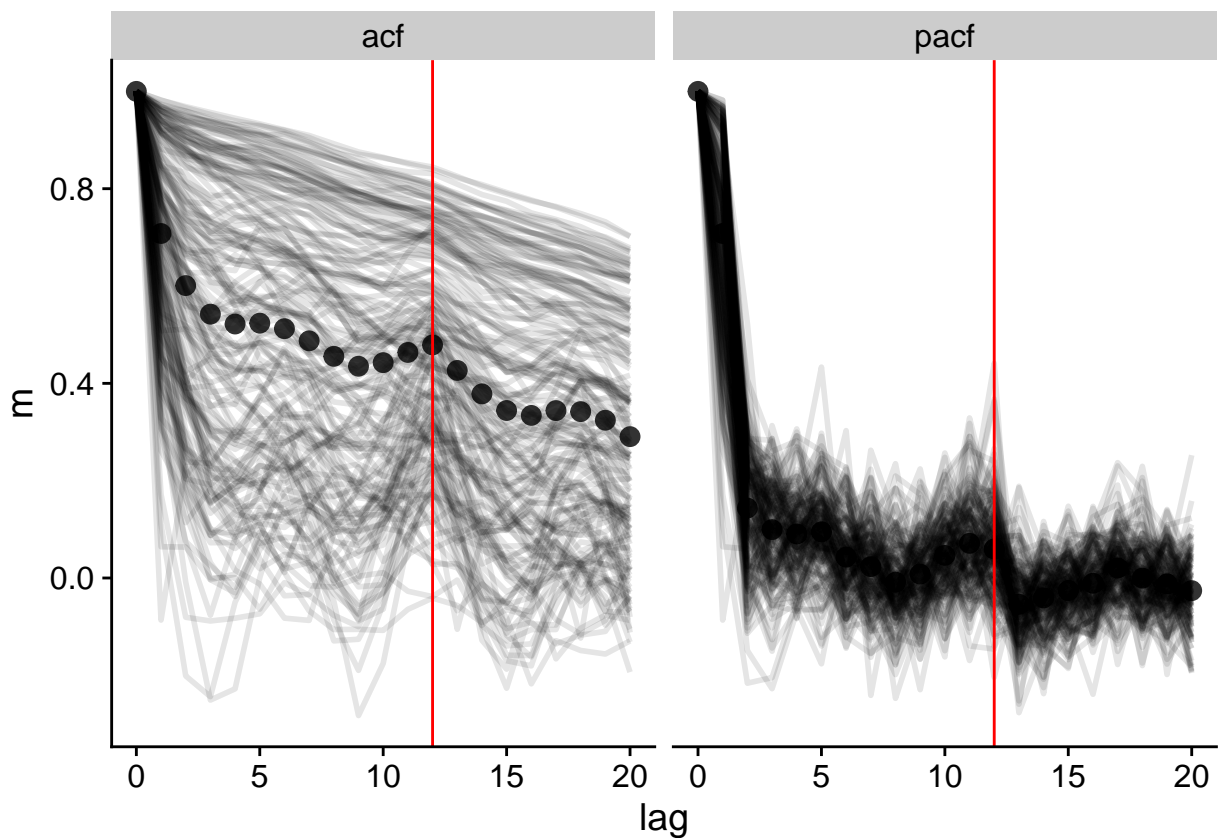

```

We see that on average series behave like a ARIMA(1,1,1) series although we can't really do much processing from the features data.

  })

```

```

}, .keep=TRUE) %>%

dfarma %>%
  summarize(
    ar=mean(ar),
    ma=mean(ma),
    intr=mean(intr),
